2,3-SUBSTITUTED INDOLE COMPOUNDS AS COX-2 INHIBITORS

Technical Field

This invention relates to novel 2,3-substituted indoles as pharmaceutical agents.

- 5 This invention specifically relates to compounds, compositions and methods for the treatment or alleviation of pain and inflammation and other inflammation-associated disorders, such as arthritis.

Background Art

- Nonsteroidal antiinflammatory drugs (NSAIDs) are widely used in treating pain
10 and the signs and symptoms of arthritis because of their analgesic and anti-inflammatory activity. It is accepted that common NSAIDs work by blocking the activity of cyclooxygenase (COX), also known as prostaglandin G/H synthase (PGHS), the enzyme that converts arachidonic acid into prostanoids. Prostaglandins, especially prostaglandin E₂ (PGE₂), which is the predominant eicosanoid detected in
15 inflammation conditions, are mediators of pain, fever and other symptoms associated with inflammation. Inhibition of the biosynthesis of prostaglandins has been a therapeutic target of anti-inflammatory drug discovery. The therapeutic use of conventional NSAIDs is, however, limited due to drug associated side effects, including life threatening ulceration and renal toxicity. An alternative to NSAIDs is
20 the use of corticosteroids, however, long term therapy can also result in severe side effects.

- Recently, two forms of COX were identified, a constitutive isoform (COX-1) and an inducible isoform (COX-2) of which expression is upregulated at sites of inflammation (Vane, J. R.; Mitchell, J. A.; Appleton, I.; Tomlinson, A.; Bishop-Bailey,
25 D.; Croxtoll, J.; Willoughby, D. A. *Proc. Natl. Acad. Sci. USA*, 1994, 91, 2046). COX-1 is thought to play a physiological role and to be responsible for gastrointestinal and renal protection. On the other hand, COX-2 appears to play a pathological role and to be the predominant isoform present in inflammation conditions. A pathological role for prostaglandins has been implicated in a number of human disease
30 states including rheumatoid and osteoarthritis, pyrexia, asthma, bone resorption, cardiovascular diseases, nephrotoxicity, atherosclerosis, hypotension, shock, pain,

cancer, and Alzheimer disease. The NSAIDs currently on market inhibit both isoforms of COX with little variation for selectivity, explaining their beneficial (inhibition of COX-2) and deleterious effects (inhibition of COX-1). It is believed that compounds that would selectively inhibit the biosynthesis of prostaglandins by intervention of the induction phase of the inducible enzyme cyclooxygenase-2 and/or by intervention of the activity of the enzyme cyclooxygenase-2 on arachidonic acid would provide alternate therapy to the use of NSAIDs or corticosteroids in that such compounds would exert anti-inflammatory effects without the adverse side effects associated with COX-1 inhibition.

A variety of indole compounds are known and are disclosed in several patent applications. The International Publication Numbers WO 96/32379 discloses N-substituted indole compounds as cGMP-PDE Inhibitors. The International Publication Numbers WO 96/37467, WO 96/37469, UK Patent Publication GB 2283745 A and US Publication Number 5510368 disclose 2-methyl-N-substituted indole compounds as cyclooxygenase-2 Inhibitors. Also, a variety of indole compounds are disclosed as agents for controlling underwater fouling organisms in European Patent Publication Number 0 556 949 A2 by Konya, Kazumi et.al. Specifically, the International Publication Numbers WO 97/09308 discloses indole compounds as neuropeptide receptor antagonists. Besides, in Sci. Pharm. 64, 577 (1996), a process for preparing a 2-ester-substituted indoline is disclosed.

wherein R^5 is C_{1-6} alkyl, R^1 , X, Q and n are as defined herein before.

5

General Synthesis

A compound of general formula (I) may be prepared by any synthetic procedure applicable to structure-related compounds known to those skilled in the art. The following representative examples as described hereinafter are illustrative and are not meant to limit the scope of the invention in anyway. Unless otherwise stated, Q, X, Z, R^1 , and n are as defined above.

10

Scheme 1:

In one embodiment, for example, a compound of the formula (VI) may be prepared according to the reaction sequences depicted in Scheme 1. (Compound (VI) corresponds to a compound (I) wherein R^1 is H, and Z is OH.)

15

Scheme 1

In brief, a compound of formula (III) is subjected to oxidative homolytic malonylation (for leading references see J. M. Muchowski et al; Can. J. Chem., **70**, 1838, 1992 and E. Baciocchi et al; J. Org. Chem., **58**, 7610, 1993). In one example, a compound of the formula (III) is reacted with a suitable malonyl radical generated from a compound of formula $\text{C(R}^4\text{)H(CO}_2\text{R}^5\text{)}_2$, wherein R^4 is hydrogen or halogen, preferably chloro, and R^5 is C_{1-6} alkyl, and a manganese(III) agent, preferably manganese (III) triacetate. The manganese(III) agent is usually used in stoichiometric amounts but, alternatively, may be made catalytic by use of a suitable reoxidizing agent such as sodium persulfate, usually in the presence of a co-catalyst such as, a silver(I) salt such as silver nitrate. A preferred reaction solvent is acetic acid; however, acetic acid-acetic anhydride or other protic solvents such as propionic acid can be used. The reaction is preferably conducted in the presence of sodium acetate or potassium acetate, but, may be conducted in solvent alone. Reaction temperatures are generally in the range of room temperature (e.g., 25°C) to reflux temperature of solvent, preferably 60°C .

to 100 °C, but if necessary, lower or higher temperature can be employed. Reaction times are, in general, from one hour to a day, preferably from 4 to 16 hours, however shorter or longer reaction times, if necessary, can be employed. In the immediate instance, the α -acetoxy compounds of formula (IV) is usually obtained as the major product. Compounds of formula (IV) can readily be transformed to compounds of formula (V) by reduction with a suitable reducing agent, for example, a trialkylsilane, sodium α -(dimethylamino)naphthalenide, lithium in liquid ammonia, sodium naphthalenide, preferably triethylsilane in a suitable protic solvent, notably, trifluoroacetic acid. Alternatively, the reaction can be conducted in a reaction inert co-solvent such as dichloromethane or 1,2-dichloroethane. Reaction temperatures are generally in the range of room temperature to reflux temperature of solvent, preferably 15 to 100 °C, but if necessary, lower or higher temperature can be employed. Reaction times are, in general, from several minutes to a day, preferably from 20 minutes to 5 hours, however shorter or longer reaction times, if necessary, can be employed. Alternatively, a compound of formula (V) may be obtained directly from a compound of formula (III) from a malonyl radical generated from (i) a suitable monohalomalonate, preferably, bromomalonate, mediated by aerial oxidation of a trialkylborane such as triethylborane (see B. Giese; In Radicals in organic synthesis: formation of carbon-carbon bonds. Pergamon Press, Oxford. pp. 86-89, 1986, and P. G. Allies and P. B. Brindley; J. Chem. Soc. (B), 1126, 1960) or, (ii) a malonic ester in the presence of a cerium(IV) salt such as cerium (IV) ammonium nitrate (for example, see E. Baciocchi et al; Tetrahedron Lett, 2763, 1986). A compound of formula (V) may be readily transformed to a compound of formula (VI) by subjection to standard saponification / decarboxylation conditions.

Scheme 2:

Alternatively, as depicted in Scheme 2, a compound of the formula (VIII) (a compound (I) wherein Z is OH), wherein R¹ is C₁₋₄ alkyl, may be prepared in an analogous manner to that of a compound of formula (VI) employing appropriate reaction conditions as described by illustration herein above from a suitable monoalkylmalonate, wherein R¹ is C₁₋₄ alkyl, W is hydrogen or a halogen, preferably bromide, and R⁵ is C₁₋₆ alkyl, from a compound of formula (III).

Scheme 2

In Scheme 2, for example, the oxidant is manganese (III) agent such as manganese (III) triacetate, or Cerium (IV) agent such as ammonium Cerium (IV) nitrate and Cerium (IV) sulfate.

Scheme 3:

In another embodiment, a compound of formula (VIII) is readily accessible from the appropriate 2-aminocinnamic acid ester (IX) wherein B is a suitable protecting group, for example, methoxycarbonyl, ethoxycarbonyl, tert-butoxycarbonyl (Boc), benzyloxycarbonyl, phenylsulfonyl, p-toluenesulfonyl, methanesulfonyl, trifluoromethanesulfonyl, methanesulfonyl or trifluoromethanesulfonyl (preferably phenylsulfonyl, p-toluenesulfonyl, methanesulfonyl or trifluoromethanesulfonyl).

[R⁵ = C₁₋₆alkyl]

[B = a suitable protecting group]

[E = halogen]

Scheme 3

In Scheme 3, the requisite 2-aminocinnamic acid ester (IX) is reacted with a compound of formula (XI), wherein Q is as defined above and E is halogen, preferably, iodo, bromo or chloro, in the presence of a suitable base. A suitable base is, for example, an alkali or alkaline earth metal alkoxide, carbonate, fluoride or hydride, such as sodium *tert*-butoxide, potassium *tert*-butoxide, sodium carbonate, potassium carbonate, cesium carbonate, sodium hydride, potassium fluoride or potassium hydride. Preferred reaction inert solvents include, but are not limited to, acetone, methyl ethyl ketone, acetonitrile, N,N-dimethylformamide (DMF), N,N-dimethylacetamide (DMA), dimethylsulfoxide (DMSO), dioxane or tetrahydrofuran (THF). Reaction temperatures are preferably in the range of -40 °C to reflux temperature of solvent (for example 200 °C), usually in the range of 0 °C to 100 °C, but if necessary, lower or higher temperature can be employed. Reaction time is in general from 2 minutes to a

day, preferably from 30 minutes to 8 hours, however shorter or longer reaction times, if necessary, can be employed. When the reaction is, for example, conducted at room temperature (e.g., 25 °C) the intermediate indoline (X) can be isolated. Reaction at higher temperatures (e.g., 40 to 100 °C) can result in formation of indole (XII).

5 Usually the intermediate indoline (X) is not isolated but either (i) hydrolyzed with committant formation of the indole ring directly to a compound of formula (VIII) under standard conditions known to those skilled in the art, or (ii) transformed to a compound of formula (XII) by using a suitable base, for example, an alkali or alkaline earth metal carbonate such as sodium carbonate, potassium carbonate or cesium carbonate, or an

10 organic base such as 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU), 1,5-diazabicyclo[4.3.0]non-5-ene (DBN), 1,4-diazabicyclo[2.2.2]octane (DABCO), pyridine, pyrrolidine, triethylamine, diisopropylamine, diisopropylethylamine, diethylisopropylamine, Hunig's base, potassium tert-butoxide, sodium tert-butoxide, or the like, or a suitable oxidant such as cerium (IV) ammonium nitrate (CAN),

15 manganese(IV) oxide, manganese(III) triacetate, copper (II) acetate / air, chloranil, 2,3-dichloro-5,6-dicyano-1,4-benzoquinone (DDQ), N-methylmorpholine-N-oxide, or the like (for example, see H. Dumoulin et al; J. Heterocycl. Chem., 32, 1703, 1995; H. Rapoport et al; Tetrahedron Lett., 5053, 1991; P. Martin et al; Helv. Chim. Acta, 77, 111, 1994; Y. Kikugawa et al, J. Chem. Soc. Perkins Trans 1, 7, 1401, 1984; A. Goti et al; Tetrahedron Lett., 6567, 1996; L. S. Liebeskind et al; J. Org. Chem, 61, 2594, 1996). Preferred reaction inert solvents include, but are not limited to, acetone, methyl ethyl ketone, acetonitrile, dioxane or tetrahydrofuran (THF). Reaction

20 temperatures are preferably in the range of 0 °C to reflux temperature of solvent, usually in the range of 15 to 60 °C, but if necessary, lower or higher temperature can be employed. Reaction time is in general from several minutes to a day, preferably from 30 minutes to 8 hours, however shorter or longer reaction times, if necessary, can be employed. A compound of formula (XII) may be readily hydrolyzed to a compound of formula (VIII) under standard conditions.

Scheme 4:

30 In another embodiment, a compound of formula (VIII), wherein Q, X, R¹ and n are as defined above, may be prepared as illustrated in Scheme 4.

[R⁵ = C1-6alkyl]

[E = halo]

Scheme 4

For example, treatment of a compound of formula (XIII), wherein R^1 , R^5 , X and n are as defined above, with a trialkyltin hydride, e.g., tributyltin hydride usually in the presence of a radical initiator such as, 2,2'-azobisisobutyronitrile (AIBN), affords the intermediate 2-stannylindole (XIV) via an intramolecular radical cyclization as described in J. Am. Chem. Soc., 116, 3127, (1994); T. Fukuyama et al. The intermediate (XIV) generated *in situ* is subsequently treated with an acyl halide, wherein Q and E are as defined above, in the presence of a suitable palladium catalyst according to Stille's procedure (for example see. J. K. Stille et al; J. Am. Chem. Soc., 109, 813, 5478, (1987) and J. Am. Chem. Soc., 106, 4833, (1984)) to afford indole (XII) which may be hydrolyzed to a compound of formula (VIII) by conventional

procedure.

Examples of the palladium catalyst are

tetrakis(triphenylphosphine)palladium(0),

In a compound of formula
 20 A-C(O)-Q, A is defined such that the compound of A-C(O)-Q is, for example, an acyl halide, carboxylic acid, carboxylic acid anhydride, a mixed carboxylic sulfonic

anhydride, or the like. The reaction may be conducted in the presence or absence of catalyst, preferably in the presence of catalyst such as, boron trifluoride-diethyl ether, tin(IV) chloride, aluminum chloride, ferric chloride, zinc chloride, iodine, iron, or the like. Preferred reaction inert solvents include, but are not limited to, diethyl ether, 5 dichloromethane, 1,2-dichloroethane, carbon disulfide, nitrobenzene or nitromethane. Reaction temperatures are preferably in the range of -78 to 210 °C, usually in the range of -10 °C to reflux temperature of solvent, but if necessary, lower or higher temperature can be employed. Reaction time is in general from several minutes to a day, preferably from 30 minutes to 8 hours, however shorter or longer reaction times, if 10 necessary, can be employed.

5 The compound of formula 7-VI has asymmetric atoms and therefore exist in different enantiomeric and diastereomeric forms. Diastereomeric mixtures can be separated into their individual diastereomers on the basis of their physical chemical differences by methods known to those skilled in the art, for example, by chromatography or fractional crystallization. The use of all such isomers, including diastereoisomer mixtures and pure enantiomers, are considered to be part of the present
10 invention.

The starting materials in the aforementioned general syntheses may be obtained by conventional methods known to those skilled in the art. The preparation of such starting materials is described within the accompanying non-limiting examples which are provided for the purpose of illustration only. Alternatively, requisite starting
15 materials may be obtained by analogous procedures, or modifications thereof, to those described hereinafter.

The products which are addressed in the aforementioned general syntheses and illustrated in the experimental examples described herein after may be isolated by standard methods and purification can be achieved by conventional means known to
20 those skilled in the art, such as distillation, crystallization or chromatography techniques.

Certain compounds described herein contain one or more asymmetric centers and are capable of existing in various stereoisomeric forms. The present invention contemplates all such possible stereoisomers as well as their racemic and resolved,
25 enantiomerically pure forms and pharmaceutically acceptable salts thereof.

Certain compounds of the present invention are capable of forming addition salts with inorganic or organic acids. The pharmaceutically acceptable acid salts of the compounds of formula (I) are those which form non-toxic addition salts, such as, but not limited to, the hydrochloride, hydrobromide, sulfate or bisulfate, acetate,
30 benzoate, besylate, citrate, fumarate, glucuronate, hippurate, lactate, tartrate, saccharate, succinate, maleate, methanesulfonate, *p*-toluenesulfonate, phosphate and pamoate (i.e.,

4,4'-methylene-bis-(3-hydroxy-2-naphthoate)) salts. The pharmaceutically acceptable acid salts may be prepared by conventional techniques.

Pharmaceutically acceptable non-toxic cations of compounds of formula (I) may be prepared by conventional techniques by, for example, contacting said compound with a stoichiometric amount of an appropriate alkali or alkaline earth metal (sodium, potassium, calcium and magnesium) hydroxide or alkoxide in water or an appropriate organic solvent such as ethanol, isopropanol, mixtures thereof, or the like.

Also included within the scope of this invention are bioprecursors (also called pro-drugs) of the compounds of the formula (I). A bioprecursor of a compound of the formula (I) is a chemical derivative thereof which is readily converted back into the parent compound of the formula (I) in biological systems. In particular, a bioprecursor of a compound of the formula (I) is converted back to the parent compound of the formula (I) after the bioprecursor has been administered to, and absorbed by, a mammalian subject, e.g., a human subject. When the compounds of the formula (I) of this invention may form solvates such as hydrates, such solvates are included within the scope of this invention.

An example of prodrug of the compound of formula (I) is a compound of the formula (I), wherein the 1st position of indole ring is substituted with a group selected from hydroxymethyl, $-C(O)-C_{1-4}$ alkyl, $-C(O)-(NH_2)CH-(C_{1-4}$ alkyl), $-C(O)$ -phenyl, $-CH_2NHC(O)$ -aryl, $-CH_2-C_{1-4}$ alkyl-O-C(O)- C_{1-4} alkyl, $-C_{1-4}$ alkyl-pyridyl, $-C(O)CH_2NR_2$ and $-CH_2N(C_{1-4}$ alkyl) $_2$.

Another example of prodrug of the compound of formula (I) is a compound of the formula (I), wherein the carboxyl group is substituted with a group selected from C_{1-4} alkyl, $-CH_2-C_{1-4}$ alkyl-O-C(O)- C_{1-4} alkyl, $-CH_2-C_{1-4}$ alkyl-O-C(O)- $N(C_{1-4}$ alkyl) $_2$, $-CH_2C(O)-N(C_{1-4}$ alkyl) $_2$, $-CH_2-C_{1-4}$ alkyl-O-C(O)-O- C_{1-4} alkyl, ethyl-OH and $-CH_2CO_2H$.

The compounds of the formula (I) of this invention can be administered via either the oral, parenteral or topical routes to mammals. In general, these compounds are most desirably administered to humans in doses ranging from 0.01 mg to 100 mg

per kg of body weight per day, although variations will necessarily occur depending upon the weight, sex and condition of the subject being treated, the disease state being treated and the particular route of administration chosen. However, a dosage level that is in the range of from 0.01 mg to 10 mg per kg of body weight per day, single or
5 divided dosage is most desirably employed in humans for the treatment of abovementioned diseases.

The compounds of the present invention may be administered alone or in combination with pharmaceutically acceptable carriers or diluents by either of the above routes previously indicated, and such administration can be carried out in single
10 or multiple doses. More particularly, the novel therapeutic agents of the invention can be administered in a wide variety of different dosage forms, i.e., they may be combined with various pharmaceutically acceptable inert carriers in the form of tablets, capsules, lozenges, trochees, hard candies, powders, sprays, creams, salves, suppositories, jellies, gels, pastes, lotions, ointments, aqueous suspensions, injectable solutions, elixirs,
15 syrups, and the like. Such carriers include solid diluents or fillers, sterile aqueous media and various nontoxic organic solvents, etc. Moreover, oral pharmaceutical compositions can be suitably sweetened and/or flavored. In general, the therapeutically-effective compounds of this invention are present in such dosage forms at concentration levels ranging 5% to 70% by weight, preferably 10% to 50% by
20 weight.

For oral administration, tablets containing various excipients such as microcrystalline cellulose, sodium citrate, calcium carbonate, dipotassium phosphate and glycine may be employed along with various disintegrants such as starch and preferably corn, potato or tapioca starch, alginic acid and certain complex silicates,
25 together with granulation binders like polyvinylpyrrolidone, sucrose, gelatin and acacia. Additionally, lubricating agents such as magnesium stearate, sodium lauryl sulfate and talc are often very useful for tableting purposes. Solid compositions of a similar type may also be employed as fillers in gelatine capsules; preferred materials in this connection also include lactose or milk sugar as well as high molecular weight
30 polyethylene glycols. When aqueous suspensions and/or elixirs are desired for oral administration, the active ingredient may be combined with various sweetening or

flavoring agents, coloring matter or dyes, and, if so desired, emulsifying and/or suspending agents as well, together with such diluents as water, ethanol, propylene glycol, glycerin and various combinations thereof.

For parenteral administration, solutions of a compound of the present invention
5 in either sesame or peanut oil or in aqueous propylene glycol may be employed. Method for assessing biological activities:

The activity of the compounds of the formula (I) of the present invention was demonstrated by the following assays.

In vitro assays

15 ***Human cell based COX-1 assay***

Human peripheral blood obtained from healthy volunteers was diluted to 1/10 volume with 3.8% sodium citrate solution. The platelet-rich plasma immediately obtained was washed with 0.14 M sodium chloride containing 12 mM Tris-HCl (pH 7.4) and 1.2 mM EDTA. Platelets were then washed with platelet buffer (Hanks
20 buffer (Ca free) containing 0.2% BSA and 20 mM Hepes). Finally, the human washed platelets (HWP) were suspended in platelet buffer at the concentration of 2.85×10^8 cells/ml and stored at room temperature until use. The HWP suspension (70 μ l aliquots, final 2.0×10^7 cells/ml) was placed in a 96-well U bottom plate and 10 μ l aliquots of 12.6 mM CaCl_2 added. Platelets were incubated with A23187 (final 10
25 μ M, Sigma) with test compound (0.1 - 100 μ M) dissolved in DMSO (final concentration; less than 0.01%) at 37 °C for 15 min. The reaction was stopped by addition of EDTA (final 7.7 mM) and TxB_2 in the supernatant quantitated by using a radioimmunoassay kit (Amersham) according to the manufacturer's procedure.

Human cell based COX-2 assay

30 **Inhibition of COX-2 activity after induction of COX-2 by hIL-1 β**

The human cell based COX-2 assay was carried out as previously described

(Moore *et al.*, *Inflam. Res.*, 45, 54, 1996). Confluent human umbilical vein endothelial cells (HUVECs, Morinaga) in a 96-well U bottom plate were washed with 100 μ l of RPMI1640 containing 2% FCS and incubated with hIL-1 β (final concentration 300 U/ml, R & D Systems) at 37 °C for 24 hr. After washing, the
5 activated HUVECs were stimulated with A23187 (final concentration 30 μ M) in Hanks buffer containing 0.2% BSA, 20 mM Hepes and test compound (0.1 nM - 100 μ M) dissolved in DMSO (final concentration; less than 0.01%) at 37 °C for 15 min. 6-Keto-PGF $_{1\alpha}$, stable metabolite of PGI $_2$, in the supernatant was quantitated after
adequate dilution by using a radioimmunoassay kit (Amersham) according to the
10 manufacturer's procedure.

Inhibition of COX-2 during the induction phase

Confluent human umbilical vein endothelial cells (HUVECs, Morinaga) in a 96-well U bottom plate were washed with 100 μ l of RPMI1640 containing 2% FCS and test compound (0.1 nM - 100 μ M) dissolved in DMSO (final concentration; less
15 than 0.01%), and incubated with hIL-1 β (final concentration 300 U/ml, R & D Systems) at 37 °C for 24 hr. After washing, the HUVECs were stimulated with A23187 (final concentration 30 μ M) in Hanks buffer containing 0.2% BSA and 20 mM Hepes at 37 °C for 15 min. 6-Keto-PGF $_{1\alpha}$, a stable metabolite of PGI $_2$, in the supernatant was quantitated after adequate dilution by using a radioimmunoassay kit

In vivo assays

Carrageenan induced foot edema in rats

Male Sprague-Dawley rats (5 weeks old, Charles River Japan) were fasted overnight. A line was drawn using a marker above the ankle on the right hind paw
25 and the paw volume (V $_0$) was measured by water displacement using a plethysmometer (Muromachi). Animals were given orally either vehicle (0.1% methyl cellulose or 5% Tween 80) or a test compound (2.5 ml per 100 g body weight). One hour later, the animals were then injected intradermally with λ -carrageenan (0.1 ml of 1% w/v suspension in saline, Zushikagaku) into right hind paw (Winter *et al.*, *Proc.*
30 *Soc. Exp. Biol. Med.*, 111, 544, 1962; Lombardino *et al.*, *Arzneim. Forsch.*, 25, 1629, 1975) and three hours later, the paw volume (V $_3$) was measured and the increase in

volume (V3-V0) calculated. Since maximum inhibition attainable with classical NSAIDs is 60-70%, ED30 values were calculated.

Gastric ulceration in rats

The gastric ulcerogenicity of test compound was assessed by a modification of the conventional method (Ezer *et al.*, *J. Pharm. Pharmacol.*, **28**, 655, 1976; Cashin *et al.*, *J. Pharm. Pharmacol.*, **29**, 330 - 336, 1977). Male Sprague-Dawley rats (5 weeks old, Charles River Japan), fasted overnight, were given orally either vehicle (0.1% methyl cellulose or 5% Tween 80) or a test compound (1 ml per 100 g body weight). Six hours after, the animals were sacrificed by cervical dislocation. The stomachs were removed and inflated with 1% formalin solution (10 ml). Stomachs were opened by cutting along the greater curvature. From the number of rats that showed at least one gastric ulcer or haemorrhaging erosion (including ecchymosis), the incidence of ulceration was calculated. Animals did not have access to either food or water during the experiment.

Data Analysis

Statistical program packages, SYSTAT (SYSTAT, INC.) and StatView (Abacus Concepts, Inc.) for Macintosh were used. Differences between test compound treated group and control group were tested for using ANOVA. The IC₅₀ (ED₃₀) values were calculated from the equation for the log-linear regression line of concentration (dose) versus percent inhibition.

Some compounds prepared in the Working Examples as described herein after were tested by these methods, and showed IC₅₀ values of 0.001 μ M to 10 μ M with respect to inhibition of COX-2.

Also, the above-mentioned most preferred compounds were tested by these methods, and showed IC₅₀ values of 0.001 μ M to 0.5 μ M with respect to inhibition of COX-2.

COX-2 selectivity can be determined by ratio in terms of IC₅₀ value of COX-1 inhibition to COX-2 inhibition. In general, it can be said that a compound showing a COX-1/COX-2 inhibition ratio of more than 2 has good COX-2 selectivity.

Some compounds prepared in Examples showed COX-1/COX-2 inhibition ratio of more than 10.

The following examples contain detailed descriptions of the methods of the preparation of compounds of formula (I). These detailed descriptions fall within the scope of the invention and serve to exemplify the above described general synthetic procedures which form part of the invention. These detailed descriptions are presented for illustrative purposes only and are not intended to restrict the scope of the present invention.

EXAMPLES

The invention is illustrated in the following non-limiting examples in which, unless stated otherwise: all operations were carried out at room or ambient temperature, that is, in the range of 18-25 °C; evaporation of solvent was carried out using a rotary evaporator under reduced pressure with a bath of up to 60 °C; reactions were monitored by thin layer chromatography (tlc) and reaction times are given for illustration only; melting points (m.p.) given are uncorrected (polymorphism may result in different melting points); structure and purity of all isolated compounds were assured by at least one of the following techniques: tlc (Merck silica gel 60 F-254 precoated plates), mass spectrometry, nuclear magnetic resonance (NMR) or microanalysis. Yields are given for illustrative purposes only. Flash column chromatography was carried out using Merck silica gel 60 (230-400 mesh ASTM). Low-resolution mass spectral data (EI) were obtained on a Automass 120 (JEOL) mass spectrometer. Low-resolution mass spectral data (ESI) were obtained on a Quattro II (Micromass) mass spectrometer. NMR data was determined at 270 MHz (JEOL JNM-LA 270 spectrometer) using deuterated chloroform (99.8% D) or dimethylsulfoxide (99.9% D) as solvent unless indicated otherwise, relative to tetramethylsilane (TMS) as internal standard in parts per million (ppm); conventional abbreviations used are: s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, br = broad, etc.

Example 296

cis- and trans-[6-Chloro-2-(4-chloro-benzoyl)-1-(toluene-4-sulfonyl)-2,3-dihydro-1H-indol-3-yl]-acetic acid ethyl ester

To 3-{4-chloro-2-[[2-(4-chloro-phenyl)-2-oxo-ethyl]-(toluene-4-sulfonyl)-amino]-phenyl}-acrylic acid ethyl ester (1.00g, 1.88 mmol) in *N,N*-dimethylacetamide (5.0 ml) was added potassium carbonate (0.520g, 3.76 mmol). The reaction mixture was stirred for four hours, poured in 1N hydrochloric acid (30 ml) and extracted with methyl *t*-butyl ether (2 X 30 ml). The organic extracts were dried with magnesium sulfate, filtered, and concentrated. The resulting solid was purified by chromatography on silica gel (ethyl acetate/hexanes 20/80) to provide [6-chloro-2-(4-chloro-benzoyl)-1-(toluene-4-sulfonyl)-2,3-dihydro-1H-indol-3-yl]-acetic acid ethyl ester as a 1 to 9 mixture of *cis* and *trans* isomers (0.488g, 49%). Some of the ¹H NMR (300 MHz, CDCl₃) significant signals are: d 1.09 (t, J = 7.2), 1.19 (t, J = 7.2), 2.44 (s), 5.40 (d, J = 4.0), 5.99 (d, J = 9.7), 6.92 (dd, J = 8.1, 1.1), 7.04 (dd, J = 8.1, 1.9), 7.52 (d, J = 8.4), 7.57 (d, J = 1.9), 7.73 (d, J = 8.3), 7.99 (d, J = 8.6). Lc-MS

analysis was performed on the mixture of diastereoisomers and indicated to products with identical mass of 531 ($M+H^+$).

5 To a solution of 3-[4-chloro-2-(toluene-4-sulfonylamino)-phenyl]-acrylic acid ethyl ester (3.00g, 7.90 mmol) in *N,N*-dimethylacetamide (15.0 ml) was added potassium carbonate (2.18g, 15.8 mmol) and 2-bromo-4'-chloroacetophenone (2.03g, 8.69 mmol). The reaction was stirred 30 minutes and 1,8-diazabicyclo[5.4.0]undec-7-ene (3.54 ml, 23.7 mmol) was added. The reaction mixture was stirred one hour,

[6-Chloro-2-(4-chloro-benzoyl)-1H-indol-3-yl]-acetic acid

To a solution of [6-chloro-2-(4-chloro-benzoyl)-1H-indol-3-yl]-acetic acid ethyl ester (200 mg, 0.532 mmol) in methanol (2 ml) and water (0.8 ml) was added
25 sodium hydroxide (137 mg, 3.43 mmol). The reaction mixture was stirred 24 hours, and was concentrated to a low volume. Water (4 ml) was added, the material was transferred to a separatory funnel and was washed with dichloromethane (5 ml). The aqueous layer was acidified to pH 1 with 1N hydrochloric acid and was extracted with ethyl acetate (15 ml). The organic layer was dried over magnesium sulfate, filtered,
30 and concentrate to afford [6-chloro-2-(4-chloro-benzoyl)-1H-indol-3-yl]-acetic acid (150 mg, 81%). The 1H NMR spectrum was identical with the one obtained for the

compound prepared by the method described in example 2.

The chemical structures of the compounds prepared in the Examples 1 to 292 are summarized in the following tables.

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 35
because they relate to subject matter not required to be searched by this Authority, namely:
Remark: Although claim 35
is directed to a method of treatment of the human/animal
body, the search has been carried out and based on the alleged
effects of the compound/composition.
2. ☐ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such
an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all
searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment
of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report
covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is
restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
